Possible advanced topics: Pathfinding (A*), Priority queue

#	Name	How to demo	Notes
1	Display map	Launch the game. The map is clearly displayed in the GUI.	Display an 11x9 grid with the sprite of each cell being visible.
2	Place towers	The player chooses a tower at the bottom. They click on a cell. The tower appears inside the cell.	- A tower can't be placed in a cell that already contains a tower. - A tower can't be placed in the first column. - A* checks if a path is still possible when placing a tower in a cell. If not, the tower is not placeable. - Placing a tower costs money. The tower is placed if the player has enough money.
3	Spawning enemies	Launch the game. Enemies spawn in a random cell in the first column every n seconds.	Enemies should spawn faster the more time passes.
4	Towers shoot at enemies	Place a tower. The tower shoots at the closest enemy when it is close enough.	- Bullets that go towards the enemy should be visible and should disappear when touching the enemy.
5	Pathfinding for enemies	Launch the game. Enemies find a path to go towards the last column.	- A* is used. - Each cell is a node. - The heuristic is calculated using the Manhattan distance.
6	Economy system	Place a tower. When an enemy is killed by a tower, the player gains money.	- The amount of money the player has is displayed in the bottom right of the window. - The player starts with 30 gold. - Each tower placement and upgrade costs money. - The amount of money gained from killing an enemy is the max HP of the enemy for normal enemies and 2 times that for other types of enemies.

7	Track amount of time survived	Launch the game. The amount of time survived is displayed in the bottom left of the window.	The amount of time survived represents the score of the player. It gives them the possibility to compare their score to the previous rounds they have played, especially since the game is infinite.
8	Lose when HP reaches 0	Let the enemies reach the last column of the grid. When the HP reaches 0, the application displays a game over screen with the amount of time survived.	The HP of the player is displayed at the top. When an enemy reaches the last column of the grid, the amount of HP that enemy had is removed from the HP of the player.
9	Upgrade for towers	Place a tower. Right-click on it. An “Upgrade” button showing how much it costs is displayed. The level of the tower should also be displayed.	When upgrading a tower, the tower has: - More range - Less cooldown - More attack damage
10	Different types of enemies	Launch the game. Fast enemies spawn after 1 minute, and tank enemies spawn after 2 minutes.	Some have more HP, others are quicker.
